

The attempt to provide limited technology to the public to secure the content providers work will only destroy the public's faith in the very technology. Protection schemes fail to work properly allowing those who want to overcome them to do so easily while those who simply want to legitimately use their property as intended are often frustrated by bad technology caused by these schemes. They will not protect the content, nor the consumer who will pay more for a broken product. The consumer will also drop out of the market for this and other consumer electronics as a result. You are killing the goose.
